Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ocision beta chain precursor - sharp-nosed viper
NyAlternate names: fibrinogenlytic venom protein
CySpecies: Agkistrodon acutus Gsharp-nosed viper)
CyBecies: Adxistrodon acutus Gsharp-nosed viper)
CyAccession: JC7135; Pc7038
RyCheng, X.; Olan, Y.; Liu, Q.; Li, B.X.Y; Zhang, M.; Liu, J.
Biochem. Biophys. Res. Commun. 265, 530-535, 1999
A/Title: Purification, characterization, and cDNA cloning of a new fibrinogenlyt
A;Reference number: JC7134; MUID:20025379; PMID:10558903

"Generation and initial analysis of more than 15,000 full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                        cells, and platelets.
SUBUNIT: Homodimer; disulfide-linked.
SUBCELLUIAR LOCATION: Type II membrane protein.
IISSUE SPECIFICITY: Expressed on the surface of activated T-cells, B-cells, natural killer cells, neutrophils, eosinophils, epidermal Langerhans cells and platelets.
DEVELOPMENTAL STAGE: Earliest inducible cell surface glycoprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CYTOPLASMIC (POTENTIAL).
SIGNAL-ANCHOR (TYPE-11 MEMBRANE PROTEIN)
                                                                                                                                                                                                                                                                                                                                                                       Proc. Natl. Acad. Sci. U.S.A. 99;16899-16903(2002).
-!- FUNCTION: Involved in lymphocyte proliferation and functions as signal transmitting receptor in lymphocytes, natural killer (NK)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          acquired during lymphoid activation.

INDUCTION: By antigens, mitogens or activators of PKC on the surface of T and B Lymphocytes. By interaction of IL-2 with the PJ5 IL-2R on the surface of NK cells.

PTM: CONSTITUTIVE SER/ITHR PHOSPHORYLAPION IN BOTH MATURE THYMOCYTES AND ACTIVATED T LYMPHOCYTES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           InterPro, IPR001304, Lectin C.

Bur. J. Immunol. 23:1643-1648(1993).

-!- FUNCTION: Involved in lymphocyte proliferation and functions as a signal transmitting receptor in lymphocytes, natural killer (NK) cells, and platelets.

-!- SUBUNIT: Homodimer; disulfide-linked.

-!- SUBUNIT: Homodimer; disulfide-linked.

-!- SUBCELDULAR LOCATION: Type II membrane protein.

-!- TISSUE SPECIPICITY: EXPRESSED ON THE SUBFACE OF ACTIVATED T CELLS, B-CELLS, NATURAL KILLER CELLS, NEUTROPHILS AND PLATELETS.

-!- DOWNINDL STARGE: Barliest inducible cell surface glycoprotein

J. Immunol. 168:240-252(2002).

J. Immunol. 168:240-252(2002).

L. FUNCTION: Plays a role as a receptor for the recognition of MHC class I HIA-E molecules by NK cells and some cytotoxic T-cells.

SUBGINIT: Can form disulfide-bonded heterodimer with CD94.

SUBGINIT: Natural killer cells.

TISSUE SPECIFICITY: Natural killer cells.

SIMILARITY: Contains I C-type lectin family domain.
                                                                                                                                                                                                 SEQUENCE FROM N.A., AND VARIANTS ASN-2 AND PHE-102.

                                                                       Nat. Struct. Biol. 4:438-441 (1997).
-!- FUNCTION: Anticoagulant protein which binds with factor IX and factor X in the presence of calcium with a 1 to 1 stoichiometry.
-!- SUBURIT: Heterodimer of chains A and B; disulfide-linked.
-!- SUBCELLULAR LOCATION: Secreted.
-!- MISCELLANEOUS: Calcium is required for ligand binding.
-!- SIMILARITY: Contains 1 C-type lectin family domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               COAGULATION FACTOR IX/FACTOR X-BINDING

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         killer cell receptor NKR-P1.";

J. Immunol. 149:1957-1963(1992).

-i- FUNCTION: May function as signal-transmitting receptor.

-i- SUBCELLULAR NOTATION: Type II membrane protein.

-i- TISSUE SPECIFICITY: Natural killer cells.

-i- SIMILARITY: Contains 1 C-type lectin family domain.

-!- FUNCTION: Plays a role as a receptor for the recognition of MHC
-!- FUNCTION: Plays a role as a receptor for the recognition of MHC
-class I HLA-E molecules by NK cells and some cytotoxic T-cells.
-!- SUBUNIT: Can form disulfide-bonded heterodimer with CD94.
-!- SUBCEDIULAR LOCATION: Type II membrane protein.
-!- TISSUE SPECIFICITY: Natural killer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LaBonte M.L., Levy D.B., Letvin N.L.; "Characterization of rhesus monkey CD94/NKG2 family members and identification of novel transmembrane-deleted forms of NKG2-A, B,

Natl. Acad. Sci. Ü.S.A. 99:16899-16903(2002).

-!- FUNCTION: Plays a role in B cell proliferation and differentiation. Associates with CDS.

-!- SUBDNIT: Homodimer; disulfide-linked.

-!- SUBCELLULAR LOCATION: Type II membrane protein.

-!- SUBCELLULAR LOCATION: Type II membrane protein.
